

Step 1: Create Your Project in Eclipse

Before involving Git, create your local project folder through Eclipse:

1. Open Eclipse IDE.
2. Click **File** → **New** → **Java Project** (or your specific project type). Use Project name as **VVIT_JFS**
3. Name your project and click **Finish**. This automatically creates the project folder on your computer.

Step 2: Create a Personal Access Token (PAT)

GitHub requires this token to act as your password for Eclipse:

1. Log in to [GitHub](#).
2. Click your **Profile Picture** (top right) → **Settings**.
3. Scroll down the left sidebar and click **Developer settings**.
4. Click **Personal access tokens** → select **Tokens (classic)**.
5. Click **Generate new token** → select **Generate new token (classic)**.
6. Enter a note (e.g., "Eclipse Token").
7. Check the box for **repo** (this allows Eclipse to upload code).
8. Scroll to the bottom and click **Generate token**.
9. **Copy the token immediately** and save it somewhere secure. You will never see it again.

Step 3: Create an Empty GitHub Repository

1. Look at the top right of GitHub and click the + icon → select **New repository**.
2. Type a **Repository name** **VVIT_JFS** (it is best to match your Eclipse project name).
3. **Crucial:** Leave "Add a README file", "Add .gitignore", and "Choose a license" **unchecked**. Keep the repository completely empty.
4. Click [Create repository](#).
5. Copy the **HTTPS URL** provided on the next screen (e.g., <https://github.com>).

Step 4: Initialize Git and Commit in Eclipse

1. Go back to Eclipse.
2. Right-click your new project folder → select **Team** → **Share Project...**
3. Select **Git** and click **Next**.
4. Check the box for **"Use or create repository in parent folder of project"**.
5. Click on your project name in the list, click the **Create Repository** button, and then click **Finish**.

6. Right-click your project folder again → select **Team** → **Commit...**
7. The **Git Staging** tab will open at the bottom. Drag your project files from the **Unstaged Changes** box down into the **Staged Changes** box.
8. Type a message like Initial Commit in the **Commit Message** box.
9. Click **Commit and Push**.

Step 5: Securely Push Your Code

1. In the **Destination Git Repository** window that pops up, paste the **HTTPS URL** you copied during Step 3 into the **URI** box. Eclipse will autofill the rest.
2. In the **Authentication** section:
 - **User:** Type your GitHub username.
 - **Password:** Paste the **Personal Access Token (PAT)** you copied in Step 2.
3. Check the box for **Store in Secure Store** so Eclipse remembers it.
4. Click **Next**, then **Next** again, and finally click **Finish**.
